

# Final Presentation: UBCO MDS Capstone - Urban Data Lab (UDL)

June 23, 2020

Connor Lee, Claudia Nikel, Eva Nguyen, Alex Tamm

# Outline

- Project Background
- Overview of the Project
  - Research Question
  - Proposed Solutions & Deliverables
- The Data
  - What the data looks like & why it's important
  - High level overview
- Project Approach
  - Problem Definition
  - Our approach
- Project Details
- Results & Analysis
- Conclusion
  - Lessons Learned
  - Difficulties
- Acknowledgments
- Questions

# Project Background

# Urban Data Lab (UDL) Capstone Client Overview

Contacts are:

- Jiachen Wei (MDS alum)
- Mike Kennedy, Ph.D

## Client Overview

- Formed in 2019 to advance data analytics capabilities and open data access on UBC Vancouver campus to address campus-wide sustainability challenges

## Data Overview

- UDL mirrored and stored live-streaming building energy datasets in InfluxDB and made it available to students and researchers
- The SKYSPARK database provides data recorded by the meters and smart devices of many UBC buildings

# Overview of Project

# Overview

## Research Question

- Based on a building's sensor data, how can the data be grouped automatically into end-use classifications?

## Proposed Solution and Deliverables

- A Python program that:
  - Queries and cleans the data required for classifying instrumentation by end-use for the Pharmacy building
  - Classifies instruments by end-use
  - Web-based Grafana dashboard
- Final report & presentation to UDL

# The Data

# What does the data look like?

# Why is the data important?

Knowing end-uses allows UDL to analyze campus wide environmental impact of upgrading specific instruments → reduce energy consumption on campus

## Why does UDL need our help?

UDL needs our help because they don't know which instruments are for which end-use. This is because:

1. Data is too granular=hard to pinpoint where the sensor belongs to
2. Data is a bit messy=duplicates & navNames that aren't processed into proper tags

This is where our data cleaning & modelling comes into play...

# Energy Consumption (EC) Sensors vs Non-Energy Consumption (NC) Sensors

Model Precision:

95.24%

# Difficulties & Lessons Learned

- Initially thought all sensors needed to be assigned an end-use label → redesign of the planned model
- Took lots of time to understand the data well enough to label it for a training & test set
- Assorted InfluxDB-related issues (i.e. all readings stored as strings instead of float data-type, unique identifier changes over time for sensor, etc)-> time spent finding fixes/work-arounds.

# Future Direction of Work

01	Accuracy Updates	<ul style="list-style-type: none"><li>• Include more UBC buildings -&gt; bigger training set</li><li>• Modify code to work with updated database structure -&gt; uniqueID+more days of data will improve accuracy</li><li>• Additional feature engineering like power consumption curve shapes</li><li>• Investigate+label hierarchy of meters in Pharmacy building → fix issue with multi-counting same energy use in pie-chart</li></ul>
02	Performance Updates	<ul style="list-style-type: none"><li>• Take advantage of new database structure to aggregate EC/NC data in queries and simplify flux query for visualization.</li><li>• Misc. optimization of code - &gt; be able to handle more data</li></ul>
03	Scalability Updates	<ul style="list-style-type: none"><li>• Build model for meter hierarchy classification (mentioned above)</li><li>• Make Feature Selection code dynamic</li><li>• Update code to work with multiple buildings</li></ul>
